[A Guide to Dissection of the Human Body](#) Feb 12 2021 This manual is intended to guide and facilitate human anatomical dissections. It is flexible enough for use in long as well as short courses. It can be particularly useful as a link with real anatomy when used together with computerised-anatomy programs, or where students do not dissect but merely look at atlases, prosections and models. There is an introduction for each anatomical region; and for each section to be dissected there is an overview, a dissection schedule which guides the student through a set of instructions, a summary and a list of objectives that are clinically important. The terminology used is the latest. The manual is suitable for medical and dental students. It is also of value for advanced knowledge of anatomy for surgery and in relation to the interpretation of normal anatomy in non-invasive imaging of anatomy for clinical diagnosis, surgical practice on cadaveric material, and in discussions about clinical problems.

Temporal Bone Dissection Guide Feb 24 2022 The second edition of this indispensable guide provides a step-by-step approach to learning the anatomy and principal procedures of temporal bone dissection starting with mastoidectomy and including approaches to the internal auditory canal and jugular foramen. The renowned authors share their collective wisdom and pearls gleaned from years of treating patients with temporal bone disease and teaching these methodologies to medical students, residents, and fellows. Procedural details are presented throughout 10 detailed chapters, accompanied by beautiful sequential illustrations and videos. One of the most complex regions of the human body, the temporal bone and adjacent skull base present unique surgical challenges. Critical neurovascular structures traverse complex pathways through the temporal bone, which itself has highly variable anatomy. Tumors and erosive lesions create additional anatomical barriers that make effective access and resection of diseased areas difficult. At the same time, the surgical skills required to navigate this anatomy are indispensable to the management of ear disease and associated disability, and provide alternative approaches with less morbidity to intracranial pathology. This book presents technical and strategic considerations for safe and effective temporal bone surgery. Key Highlights: Videos of cadaveric and surgical dissections highlight critical technical steps and appropriate execution More than 160 meticulous, expertly illustrated pen and ink drawings of progressive dissections A new chapter on middle ear endoscopy details key anatomical features and technical maneuvers integral to this approach New chapters on infratemporal surgical dissection and the intraoperative management of complications are also presented Expanded coverage of the middle fossa approach to the internal auditory canal and methods of assessing competencies when training novice surgeons in temporal bone dissection This is a must-have tool that will enable residents and novice surgeons to translate laboratory skills to the operating room and perform safe, efficacious and efficient dissection of the temporal bone. It is the quintessential learning guide for residents in otolaryngology-head and neck surgery and skull base surgery, as well as an excellent teaching and assessment tool for faculty.

The guide can be used as a stand-alone dissection guide or in conjunction with any Anatomy and Physiology Laboratory Manual.

Guide to the Dissection of the Dog Jul 20 2021 This manual represents an experiment both as to choice of animal and plan of work. The dog has been chosen as subject of dissection instead of a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using the horse or ox owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected without removing it from the thorax. Terms used in veterinary anatomy are largely taken from human anatomy. Since in the dog structures closely resemble those of man, an advantage in making homologies to the mutual benefit of teacher and student results. In general all terms have been Anglicized except most names of muscles, and even these Latin names have been used as

if they were English in some places. The Latin terms were retained to differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them. The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger and Baum, and Sisson and Grossman have been used frequently as references. It is probable that both have influenced the terminology more than they should, since a uniform terminology is desired by all anatomists.
